

Customer Shopping Behaviours Analysis

1. Project Overview

This project analyzes customer shopping behavior using transactional data from 3,900 purchases across various product categories. The goal is to uncover insights into spending patterns, customer segments, product preferences, and subscription behavior to guide strategic business decisions.

2. Dataset Summary

- Rows: 3,900
- Columns: 18
- Key Features:
 - Customer demographics (Age, Gender, Location, Subscription Status)
 - Purchase details (Item Purchased, Category, Purchase Amount, Season, Size, Color)
 - Shopping behavior (Discount Applied, Promo Code Used, Previous Purchases, Frequency of Purchases, Review Rating, Shipping Type)
 - Missing Data: 37 values in Review Rating column.

3. Exploratory Data Analysis using Python

We began with data preparation and cleaning in Python:

Data Loading: Imported the dataset using pandas.

Initial Exploration: Used `df.info()` to check structure and `describe()` for summary statistics.

Missing Data Handling: Checked for null values and imputed missing values in the Review Rating column using the median rating of each product category

Column Standardization: Renamed columns to snake case for better readability and documentation.

Feature Engineering:

- Created **age_group** column by binning customer ages.
- Created **purchase_frequency_days** column from purchase data.

Data Consistency Check: Verified if **discount_applied** and **promo_code_used** were redundant; dropped **promo_code_used**.

Database Integration: Connected Python script to PostgreSQL and loaded the cleaned **DataFrame** into the database for SQL analysis.

4. Data Analysis using SQL (Business Transactions)
